When you need more than just intensive care.

Beyond intensive care.
Fortis Introduces Super ICU

Where the best of our internationally trained critical care experts, ICU nurses trained under the special Critical Care Programme, and state-of-the-art technology, ensures that our patients get the constant care they need. With APACHE, a risk-assessment based scoring system, which helps us to determine the criticality of admitted patients, we can focus clinical care and prompt interventions, as per the severity of the disease process, making sure we can provide the right care at the right time. So when it comes to intensive care, we are a cut above the rest.

Caring and Care in the ICU

We believe in balancing the relationship between technical intensive care and the human values of caring. Strong emphasis is placed on making regular and daily updates to relatives, so that they remain involved in the decision-making process and are allayed of any anxieties.

Building a Kinder ICU

With an emphasis on development and environmental approaches to healing, we put our patients and their families first. Patients are provided with a specially designed environment, which is conducive to developing strong doctor-patient relationships.

Making a Science of Patient Safety

- Firmly established ‘Culture of Safety’
- Computerised indenting
- Regular CMEs / training sessions for the nursing staff and junior doctors
- Interdisciplinary communication is maintained

Critical Care Nutrition

Have an algorithm to improving nutrition - therapies for the critically ill patients, as proper nutrition - management is one of the major factors for the best outcome.

NICU & PICU set-up

Neonatal Intensive Care Unit (NICU)
- Level 3 NICU with trained vastly experienced Consultants and a team of dedicated doctors and nurses with ability to look after babies as premature as 24 weeks or as having birth weight as low as 500 grams.
- Doctor led retrieval service – very sick newborn babies are transferred in a transport incubator from any outside hospital or nursing home by our own team.
- Ability to provide high frequency oscillatory ventilation in addition to conventional ventilation, invasive blood pressure monitoring in addition to conventional monitoring.
- Neonatal surgeries with excellent post-op backup
- Nephrology support including dialysis are done
- Tertiary level unit led by specialised Consultant with specific training for paediatric intensive care and a team of paediatric trained doctors and nurses
- Ability to provide intensive monitoring and support for all organ systems like ventilation, supporting blood pressure, providing dialysis on the unit, lowering intra cranial pressure etc.
- Managing patients undergoing complicated neurosurgies, renal transplants, spinal surgeries, urosurgery etc.
- Family centred approach with regular, intensive communication with the family. Parents have unrestricted access and can visit their child anytime and as many times as they wish even when they are on the PICU

Paediatric Intensive Care Unit (PICU)
- Managing patients undergoing complicated neurosurgies, renal transplants, spinal surgeries, urosurgery etc.
- Family centred approach with regular, intensive communication with the family. Parents have unrestricted access and can visit their child anytime and as many times as they wish even when they are on the PICU

Data
- The average CLABSI rate of central line rate is consistently better than the CDC-NHSE rate
- Average VAP (Possible VAP) rate of ventilator days is by far better than the CDC-NHSE rate
- Crude Mortality rate is less than 4%
- Length of stay (more than 6 days) is less than 5%
